SECTION 2. HAZARDS IDENTIFICATION

Emergency Overview
The product, as shipped, poses a minimal inhalation health hazard because the bulk of the particles are in the non-inhalable size range. However, if during handling or use the particles are broken down to a size that can be inhaled, the dusts may be harmful to the respiratory system. Product dust may be irritating to eyes, skin and respiratory system.

Potential Health Effects
Repeated exposure to: DuPont has classified this material as a known human carcinogen. May cause cancer after repeated inhalation of spray or dust. Adverse effects from repeated inhalation may include: Chronic lung disease with alterations in lung function or difficulty breathing

SECTION 4. FIRST AID MEASURES

- Skin contact : Wash off with soap and water.
- Eye contact  : Rinse with plenty of water.
Inhalation: Remove person to fresh air. If signs/symptoms continue, get medical attention.

Ingestion: No specific intervention is indicated. Consult a physician if necessary.

**SECTION 5. FIREFIGHTING MEASURES**

Flammable Properties
- Flash point: does not flash

Suitable extinguishing media: Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.

Firefighting Instructions: The product itself does not burn.

**SECTION 6. ACCIDENTAL RELEASE MEASURES**

NOTE: Review FIRE FIGHTING MEASURES and HANDLING (PERSONNEL) sections before proceeding with clean-up. Use appropriate PERSONAL PROTECTIVE EQUIPMENT during clean-up.

Safeguards (Personnel): Avoid breathing dust.

Spill Cleanup: Pick up and arrange disposal without creating dust. After cleaning, flush away traces with water.

Accidental Release Measures: Do not flush into surface water or sanitary sewer system.

**SECTION 7. HANDLING AND STORAGE**

Handling (Personnel): Avoid formation of additional inhalable particles. If handling inhalable particulates, use of gloves and washing before eating, drinking, applying cosmetics or smoking is advisable to minimize dust inhalation or ingestion of residue from hands. Avoid breathing dust. Wash hands before breaks and at the end of workday.

Handling (Physical Aspects): This is a fully oxidized mineral product. As such it cannot support combustion.
or participate in a dust explosion.

Storage : Keep container tightly closed in a dry and well-ventilated place.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering controls : Use sufficient ventilation to keep employee exposure below recommended limits. If using this product as an abrasive blast agent in confined areas, airborne dust levels should be controlled by physical enclosure of the abrasive blasting operation. The enclosure should be exhaust ventilated in accordance with 29 CFR 1910.94 Ventilation (a) Abrasive blasting.

Personal protective equipment

Respiratory protection : A certified air-purifying respirator with a type 100 (high efficiency) particulate cartridge or canister may be permissible under certain circumstances where airborne concentrations are expected to exceed exposure limits. Use a certified positive pressure air-supplied respirator in circumstances where air-purifying respirators may not provide adequate protection. For abrasive blasting use a type CE abrasive-blast supplied-air respirator covering head, neck, and shoulders to provide protection from rebound abrasive per 29 CFR 1910.94 (a)(5).

Evaluations as to which personnel may require respiratory protection should include consideration of potential exposure to bystanders near dust generating activities such as, for example, abrasive blasting.

Eye protection : Wear safety glasses with side shields.

Skin and body protection : Where there is potential for skin contact have available and wear as appropriate impervious gloves, apron, pants, and jacket.

Protective measures : The stated hazards of this material are based on non-inhalable particles that are the bulk fraction of the delivered product. However, if during handling or use the particles are broken down to the inhalable or respirable size range, the dusts may be harmful to the respiratory system. Inhalable quartz is an IARC Category 1 carcinogen and applicable exposure limits should be referenced.

* AEL is DuPont's Acceptable Exposure Limit. Where governmentally imposed occupational exposure limits which are lower than the AEL are in effect, such limits shall take precedence.

### SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

- **Form**: Solid form, crystalline
- **Color**: red brown
- **Odor**: odourless
- **Melting point/range**: 1,370 °C (2,498 °F)
- **Specific gravity**: 3.7
- **Water solubility**: insoluble

### SECTION 10. STABILITY AND REACTIVITY

- **Stability**: Stable
- **Incompatibility**: None.

### SECTION 11. TOXICOLOGICAL INFORMATION

- **DuPont™ Starblast® XL Inhalation**: The objective of the study was to compare the lung toxicity of a set of abrasive substitutes for silica dust (garnet, staurolite, coal slag, specular hematite, and treated sand) to that of blasting sand. Rats
were intratracheally instilled with 2.5 or 10 mg/kg of the various test substances and pulmonary toxicity endpoints were measured at 4 weeks postexposure. The biomarkers included lung inflammation and cytotoxicity endpoints. In addition, the investigators measured alveolar macrophage activation. The results indicated that blasting sand produced evidence of pulmonary toxicity/inflammation and lung fibrosis. Garnet, staurolite, and treated sand exposures induced pulmonary hazard effects and inflammation that were viewed as similar to blasting sand, while coal slag instillation produced greater pulmonary damage and inflammation than blasting sand. In contrast, specular hematite did not significantly increased levels of inflammation and cytotoxicity and did not stimulate macrophage activation. [Hubbs AF et al., Toxicological Sciences volume 61: 135-143, 2001]

The results of this study should be viewed as a preliminary, screening-type pulmonary toxicity study which utilized very high, overload doses. Subsequently, the NIOSH researchers followed up on the Hubbs et al., study with another lung toxicity screening study of blasting agents [“Comparative pulmonary toxicity of blasting sand and five substitute abrasive blasting agents” – DW Porter et al., J Toxicol Environ Health A 65:1121-40, 2002]. The additional test substances included steel grit, copper slag, nickel slag, crushed glass and olivine. The authors reported that steel grit produced less lung toxicity than blasting sand or any of the other abrasive blasting substitutes

Repeated dose toxicity

Oral rat

No toxicologically significant effects were found.

Inhalation rat

No toxicologically significant effects were found.

Carcinogenicity

In lifetime inhalation studies rats were exposed for 2 years to respectively 10, 50 and 250 mg/m³ of respirable TiO₂. Slight lung fibrosis was observed at 50 and 250 mg/m³ levels. Microscopic lung tumours were also observed in 13 percent of the rats exposed to 250 mg/m³, an exposure level that caused lung overloading and impairment of rat lungs clearance mechanisms.

In further studies, these tumours were found to occur only under particle overload conditions in a uniquely sensitive species, the rat, and have little or no relevance for humans. The pulmonary inflammatory response to TiO₂ particles exposure was also found to be much more severe in rats than in other rodent species.

In February 2006, IARC has re-evaluated Titanium dioxide as pertaining to Group 2B: "possibly carcinogenic to humans", based upon inadequate evidence in humans and sufficient evidence in experimental animals for the carcinogenicity of titanium dioxide. IARC evaluation guidelines consider the generation of tumours, in 2 different studies within the same animal species, to be adequate criteria for an assessment of sufficient evidence.

The conclusions of several epidemiology studies on more than 20000 TiO₂ industry workers in Europe and the USA did not suggest a carcinogenic effect of TiO₂ dust on the human lung. Mortality from other chronic diseases, including other respiratory diseases, was also not associated with exposure to TiO₂ dust.

Based upon all available study results, DuPont scientists conclude that titanium dioxide will not cause lung cancer or chronic respiratory diseases in humans at concentrations experienced in the workplace.

Mutagenicity

Did not cause genetic damage in animals.

Tests on bacterial or mammalian cell cultures did not show mutagenic effects.

Further information

The toxicological data has been taken from products of similar composition.
Quartz (non-inhalable)

Dermal : No adverse effects expected.

Oral ALD - Approximate Lethal Dose : > 11,000 mg/kg, rat

Skin irritation : No skin irritation, animals (unspecified species)

Eye irritation : slight irritation, animals (unspecified species)

Skin sensitization : Did not cause sensitisation on laboratory animals, animals (unspecified species)

Mutagenicity : Did not cause genetic damage in cultured bacterial cells.

Skin sensitization : Did not cause sensitisation on laboratory animals, animals (unspecified species)

Mutagenicity : Did not cause genetic damage in cultured mammalian cells was observed in some laboratory tests but not in others.

Reproductive toxicity : No adverse effects expected.

Quartz

Dermal : No adverse effects expected.

Oral ALD - Approximate Lethal Dose : > 11,000 mg/kg, rat

Skin irritation : No skin irritation, animals (unspecified species)

Eye irritation : slight irritation, animals (unspecified species)

Skin sensitization : Did not cause sensitisation on laboratory animals, animals (unspecified species)

Repeated dose toxicity : Inhalation

Carcinogenicity : An increased incidence of tumours was observed in laboratory animals.

Mutagenicity : Did not cause genetic damage in cultured mammalian cells was observed in some

SECTION 16. OTHER INFORMATION

HMIS

Health : 1
Flammability : 0
Reactivity/Physical hazard : 0
PPE : Personal Protection rating to be
supplied by user depending on use conditions.

Restrictions for use: Do not use DuPont materials in medical applications involving implantation in the human body or contact with internal body fluids or tissues unless the material has been provided from DuPont under a written contract that is consistent with DuPont policy regarding medical applications and expressly acknowledges the contemplated use. For further information, please contact your DuPont representative. You may also request a copy of the DuPont POLICY Regarding Medical Applications and DuPont CAUTION Regarding Medical Applications.

These products may not be directly added to food or pharmaceuticals and are not recommended for use in medical devices or cosmetics.

Starblast® is a registered trademark of E.I. du Pont de Nemours and Company.

Starblast® XL contains trace quantities of naturally occurring radioactive uranium and thorium (less than or equal to 10 ppm uranium plus 70 ppm thorium = 80 ppm total U + Th or 0.008 % w/w, equivalent to 11 pCi/g or less), and radium (less than or equal to 11 pCi/g). Naturally Occurring Radioactive Material, namely uranium, thorium, and their decay products, including radium, is commonly referred to as "NORM".

The main radiological hazard from the product is internal exposure from small amounts of alpha particles given off by inhaled dust. Industrial hygiene practices aimed at control of airborne dust can lessen the potential for exposure. Overexposure by inhalation to inhaled dusts containing radioactive uranium, thorium, and radium may cause lung cancer. Low level gamma radiation in proximity to bulk or bagged stockpiles of these products may present a lesser, external exposure that can be managed by limiting close proximity for long time periods to large volumes of material.

With respect to dust exposure, evaluation and calculation based upon dosimetry (ICRP 68) yield the following guidance to ensure that inhalation intake is less than a 100 mrem/yr public dose reference point for radionuclides.

For a total dust with aerodynamic diameter of 1 um, the calculated reference dust level is 17.4 mg/m³. For a total dust with aerodynamic diameter of 5 um, the calculated reference dust level is 27.0 mg/m³. For a total dust with aerodynamic diameter of 10 um, the calculated reference dust level is 39.8 mg/m³.

The calculations noted above are based upon 8 hr/day TWAs. It should be noted that for these products, the actual particle physical diameter is approximately 1/2 the effective aerodynamic diameter. For these products, as shipped, with essentially no particles as small as calculated above, the highest total dust level can provide a conservative limit. However, if during handling or use the particles are broken down to finer particle sizes, lower levels of total dust would apply.
These reference calculations for radionuclides may or may not provide the most conservative recommendation vs. other trace contaminants as compared to specific country dust contaminant limit calculations. It is recommended that the user compare and calculate or measure for specific contaminants vs. reference limits, especially if particles are broken down, to determine the most appropriate standard for protection.
